

# A BETTER RECIPE FOR TOTAL WORKER HEALTH

## The Client

A food production and distribution company with approximately 1,000 employees who work across three different sites.

## The Challenge

When any on-site injuries occurred, our client would send the injured employees to a nearby walk-in clinic or the local hospital emergency room. Their reactive approach to injuries was causing their DART Rate to **steadily increase** with each passing year.

## Our Solution

One of our Certified Early Intervention Specialists (CEISs) implemented the following:

- Pre-shift warm-up programs to make sure employees' bodies are ready for the day.
- Exams for incoming employees to check that they are physically able to meet the essential job functions of the position.
- Early reporting culture to ensure discomfort is reported as soon as possible so that first aid treatment can be an effective solution.

KEY OUTCOME

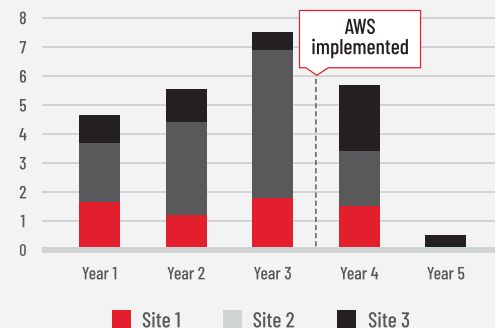

90%

reduction in  
DART Rate

## Our Impact

In the first two years of our CEIS being on site, our client experienced a **significant reduction in DART Rate** - moving from above the industry standard to well below it.

## DART Rate for Three Sites of Coverage
